▷ SETUP GUIDE

RETRO UI
WEBSITE TEMPLATE

Bold, flat, candy-coloured. Thick black borders, hard shadows, and a chunky monospace font. 7 pages of plain HTML — no builder, no monthly fees. Open it, change the words, pick your colours, publish.

pages.txt

THE 7 PAGES

FILE	WHAT IT IS
`index.html`	Home — hero + window cluster + recent links
`about.html`	About you + quick facts
`work.html`	Portfolio grid (one window card per project)
`gallery.html`	Image grid (swap colour blocks for photos)
`links.html`	Link-in-bio (a stack of big buttons)
`blog.html`	Journal / posts
`contact.html`	Contact form + your details

Plus `style.css` (all the styling + colours), `script.js` (mobile menu, live clock, footer year), and an `assets/` folder for your images.

need-to-know

No coding needed for the basics — you just find `<!-- EDIT -->` comments and change the words. Everything is free to publish. The font loads from Google, so the site looks its best with internet.

1 QUICK START

start-here

1. **Unzip** the folder you downloaded.
2. **Double-click** `index.html` — it opens in your web browser. That's your whole site, running right now.
3. Open any `.html` file in a text editor (Notepad, TextEdit, or a free one like VS Code).
4. Press **Ctrl+F** (Cmd+F on Mac) and search for `EDIT`. Every `<!-- EDIT -->` comment marks a spot for your own words.
5. Replace the brand `MAYA.SYS` / "Maya Rivera" with yours.
6. **Save**, then refresh the browser tab to see the change.

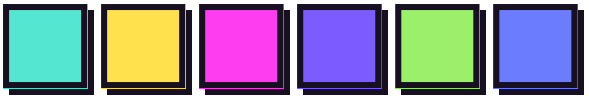

That's the whole loop: **FIND EDIT** **CHANGE WORDS** **SAVE** **REFRESH**

tips.txt

- Keep the `<!-- EDIT -->` comments — they're harmless and help you find your way later.
- When adding things, copy a whole block rather than typing tags by hand.
- If a page looks broken, you probably deleted half a tag — press Ctrl+Z to undo.

2 CHANGE YOUR COLOURS

Recolour the **whole site at once** from one place: the `:root` block at the very top of `style.css`. Change a hex code there and every page updates.

```
:root{
  --ink:#161020;      /* outlines + text */
  --paper:#ffffff;    /* window body */
  --cyan:#54e6d0;
  --yellow:#ffe14d;
  --magenta:#ff3df0;
  --purple:#7c5cff;
  --bg1:#9fe9ff;      /* background top-left */
  --bg2:#c9b8ff;      /* background bottom-right */
  --bw:3px;           /* border thickness */
  --shadow:6px 6px 0 var(--ink);  /* hard shadow */
}
```

what they do

VAR	CONTROLS
`--ink`	All black outlines, shadows, text
`--cyan` / `--yellow` / `--magenta` / `--purple`	The four candy accents (tabs, bars, buttons)
`--bg1` / `--bg2`	The diagonal page background
`--bw`	Border weight — try 2px or 4px

More ready-made palettes are in `docs/COLORS.md`

paste-a-palette

Mint Soda — paste over the accent lines:

```
--cyan:#36e0b8;
--yellow:#f4f185;
--magenta:#ff77c6;
--purple:#6c63ff;
--bg1:#d6fff0;
--bg2:#c2e9ff;
```

3 EDIT YOUR CONTENT

Everything you change is marked with an `<!-- EDIT -->` comment. Search for `EDIT` in each page. Here are the main ones:

add a project — work.html

Each project is one window card. Copy a whole `<article>…</article>` block, paste it, and edit the title, text, and tags. Change the bar colour (`bar cyan/magenta/yellow`) and thumb (`thumb a/b/c`) freely.

```
<article class="win card">
  <div class="bar magenta"><span class="ttl">project-02</span></div>
  <div class="thumb b">✦</div>
  <div class="body"><h3>Your Project</h3><p>One line.</p>
    <span class="tag">Tag</span></div>
</article>
```

real photo — gallery.html

Put your image inside the coloured block:

```
<div class="pic">
  <img src="assets/me.jpg">
</div>
```

links — links.html

Set each button's text + link:

```
<a href="https://..."
   class="btn magenta">
   ★ My Portfolio</a>
```

brand name + blog post

- **Brand:** in each page's top menu, change `MAYA.SYS` after `<!-- EDIT: brand name -->`. The dot `<span class="blip">` is your logo.
- **Blog post:** in `blog.html`, copy a `<article class="win">` block and edit the date, title, and text.

Full step-by-step in `docs/EDIT-GUIDE.md`.

4 CONNECT THE CONTACT FORM

The form in `contact.html` is **front-end only** — by itself it doesn't send email. Pick one of these (both free):

Option A — Formspree (recommended)

1. Sign up free at **formspree.io** and create a form.
2. It gives you a URL like `https://formspree.io/f/abcdwxyz`.
3. In `contact.html`, change the form tag (drop `onsubmit="return false"`):

```
<form action="https://formspree.io/f/abcdwxyz"
      method="POST">
```

Give the inputs a `name` (e.g. `name="email"`) so messages are labelled, then send yourself a test.

Option B — mailto (simplest)

No sign-up. Replace the Send button with a link that opens the visitor's email app:

```
<a href="mailto:you@email.com"
   class="btn magenta">Email Me →</a>
```

Details in `docs/PUBLISH.md`.

5 PUBLISH YOUR SITE

It's just plain files, so almost anything can host it — all free:

pick any

- **Easiest — Netlify Drop:** go to `app.netlify.com/drop` and drag the whole folder onto the page. Live in seconds.
- **GitHub Pages:** upload the files to a repo → Settings → Pages → build from `main` / root.
- **Cloudflare Pages / Vercel:** free tier, import the folder or repo.
- **Your own host:** upload the files into `public_html` via cPanel or FTP. Keep `index.html` at the top.

? FAQ

faq.txt

DO I NEED INTERNET FOR THE FONT?

The site loads **'Space Mono'** from Google Fonts, so it looks its best online. Offline, text falls back to your device's monospace font — the layout still works.

WHY DOESN'T THE CONTACT FORM SEND ANYTHING?

It's front-end only by design. Connect it to Formspree, or switch to a `mailto:` link (Section 4).

HOW DO I ADD A WHOLE NEW PAGE?

Make a copy of an existing page (e.g. duplicate `about.html` and rename it), change its content, then add a link to it in the top menu (the `<nav>` list) on every page.

CAN I CHANGE THE BORDERS / SHADOWS?

Yes — edit `--bw` (border thickness) and `--shadow` in `style.css` `:root`. See Section 2.

Thank you for your purchase — and if you love it, a review means the world. ★
